# 4 of 6 CMIP7 models so far have lower ECS than their CMIP6 predecessor

But 4 of 6 remain above the AR6 likely ECS range (2.5–4 °C) and 1 above the very likely range (2–5 °C).
ECS: Gregory regression, 150 yr abrupt-4xCO2. TCR: 1pctCO2 years 61–80. Lower = 5–95% regression ranges do not overlap (5 if only the predecessor's central value must lie outside the CMIP7 range). Predecessor pairings by model family (our assumption).
